Clarke group

Creating a project based on the static site generator Hugo and git CMS CloudCanon. My work was to set up and develop the backend logic (Go + Hugo + Cloudcanon), transfer the design from Figma (SCSS + jquery + vanilla js), integrate the map and contact form into the cloudcanon logic.

TECHNOLOGIES

HUGO | JS | SCSS | Bootstrap

Bullion & Collectibles Exchange

Developed an e-commerce platform for trading precious coins, addressing tasks such as warehouse API synchronization, payment service integration, interface design, and content creation optimization.

Successfully implemented synchronization, ensured payment security, crafted an appealing and user-friendly interface, and streamlined content creation processes.

TECHNOLOGIES

Laravel | Vue | Bagisto | Stripe API

Levhaolam

I worked as a full stack developer. My tasks included working with several modules of the site, such as: Laravel: Job development, synchronization between services, middleware creation, bug fixes, refactoring, design integration.

The main work was focused on refactoring and small fixes of payment systems integrations. Lumen: Creating relationships between services. Development of a module for parsing mail and sending it to Telegram and other services. Telegram bot development. Parsing emails using regular expressions. WordPress: Creating modules for building pages. Creating custom data types. Development of the back-end part and implementation of design into the WordPress logic. Page layout and style changes. Creating modules for the WordPress editor.

Bikeride

Bicycle review aggregator. I worked on this project for 2 years. During this time, I rewrote all the old code for more optimal work (from Woocommerce logic to Custom data types). Optimized the site. Developed templates and integrated various APIs. One of the site modules was working with affiliate links. Rewritten work with Amazon Api, added eBay Api and Avantlink Api.

Optimized task cron performance. Working with prices and their calculation. Working with the rating system. The second module of the site was the event system. The system for parsing events from API was re-created. Added changes to the frontend template. Optimized work speed. The system working with Google maps has been rewritten.

TECHNOLOGIES

Wordpress | JS | Amazon API | Ebay API
